## P R E F A C E.

---

ALL practical engineers are well aware, by experience, of the inconveniences which arise from the length of time necessary for calculating the cubic quantity of earth-work in the cuttings and embankments of canals, railways, and turnpike roads, especially when the section is of considerable extent, and the ground very uneven. As calculations of this kind are frequently, on a short notice, required to be completed within a limited period; the consequence is, that errors are almost sure to be made, as a multiplicity of figures are necessary, though the calculations in themselves are so simple.

To save time in making these calculations, and insure accuracy in the results, were the principal objects I had in view in constructing the following Tables; how far I have succeeded, must be left to the decision of practical men, for whose use they were intended, and who are best able to judge of their utility.

An advantage may arise from the use of these Tables, which I had not at first contemplated. By the common but erroneous method of calculation, the cuttings may appear to be equal to the embankments; yet, when the work is carried into effect, a large quantity of earth may be required to make up the embankments, or there may be

too much earth in the cuttings for the embankments, according to the shape or figure of the section, as will be shown hereafter. Such a circumstance as this cannot take place if the following Tables be used to ascertain the cubic quantities; for as they are calculated from the prismoidal formula, they will give the true cubic quantity in any cutting or embankment; and consequently, if the cuttings be laid down on the section to balance the embankments, they will be found in practice to do so, when the work comes to be executed.

Contractors very frequently find that they have more earth to move than they had previously calculated upon from the section, and are, therefore, often great losers. This, in most cases, arises from erroneous calculations; for the common practice is, either to add the two extreme heights together, and to take half the sum for a mean height; or to take half the sum of the areas at each end for a mean area. Both these methods are erroneous; one makes the quantity too much—the other too little.

In calculating the Tables and correcting the press, every care that was possible has been taken to ensure accuracy—every tenth line has been calculated twice over, and the intermediate figures filled up by interpolation; so that it is hoped very few errors of any importance will be found in them.

The first series of tables from No. 1 to 22, inclusive, are calculated to bases, which very frequently occur in practice, both in canals, railways and turnpike roads; in these Tables the calculations were carried to six places of decimals, although two only are retained in the printing, as sufficient for practical purposes.

In the second series, from No. 23 to 33, the multipliers were calculated to eight places of decimals, and the additional columns to six places of decimals, although only

four places of decimals in the former and three places in the latter are retained; but the last figure in each case has been increased by one, when the following figure amounted to five, or any higher number.

The tables of the third series, from 34 to 36, are particularly adapted for turnpike roads, as they are calculated to the bases and slopes recommended by Mr. Telford, and which he has employed in the improvements on the Holyhead road.

An additional table has been added, which will be found useful in calculating the quantity of land necessary for forming canals, railways, and turnpike roads.

The Tables were nearly worked off before I was aware of Mr. Babbage's valuable investigation as to the best tint of paper, and form of type for insuring distinctness in tabular printing. Had I been aware of it I should certainly have availed myself of his important suggestions.

Although this work has not been published under the immediate direction of the Institution of Civil Engineers, yet I am happy to say it has been considered by them as a work of *practical utility*, and as such they have authorised me to dedicate it to them, as will be seen by the annexed copy of a letter from their Secretary.

*London, July 1st, 1833.*

*Institution of Civil Engineers,  
Cannon Row, Jan. 10, 1833.*

DEAR SIR,

I have the pleasure to forward you a Copy of the Resolution, passed at the ordinary Meeting of the Institution of Civil Engineers on Tuesday last, expressing their approbation of your Tables on the cubic content of earthwork.

“ It was moved by James Walker, Esq, seconded by B. Donkin, Esq., and carried unanimously—

That Mr. Macneill be allowed to dedicate to this Institution, the Tables which he has calculated, for ascertaining the quantity of earth-work in the cuttings and embankments of canals, railways, and turnpike roads.”

I am, dear Sir,

Your's very truly,

G. C. GIBBON, SEC.

*To John Macneill, Esq.*

DEMONSTRATION  
OF  
THE PRISMOIDAL FORMULA,

BY WHICH THE TABLES WERE CALCULATED.

---

Let ABCGFKDE (Fig. 1. Plate I.) represent a prismoid or solid figure similar to that which is formed in excavations or embankments, in which BCDK represents the road-way, and ABCG, FKDE parallel cross sections at each end. The cubic content of this solid is equal to the areas of each end, added to 4 times the mean area, and the sum multiplied by the length of the prismoid divided by 6.

That is, to the area ABCG + area FKDE + 4 times the area *abcd*, multiplied by  $\frac{CD}{6}$  :

Bisect the breadth of the road-way KD in the point O ; from the point O raise the perpendicular ON, which will represent the depth of cutting at the lower end of the section ; in the same manner bisect BC, in the point M, and raise the perpendicular ML, which will represent the depth of cutting at the upper end of the section ; on this perpendicular lay off from the point M, a distance MQ, equal to ON, the perpendicular height of the lower end of the section ; through the point Q, draw the line HI parallel to BC, this line HI will be equal to the line FE, as the planes are parallel, and

the angles of the slopes  $ABC$ ,  $BCG$  are supposed to be equal to the angles  $FKD$ ,  $KDE$ . If then we suppose a plane  $HIEF$  to be drawn through the lines  $HI$  and  $EF$ , it will be parallel to the base  $BCKD$ , and will divide the solid  $ABCGFKDE$  into two others, one of which will be the regular prism  $HBCIFKDE$ , and the other will be a wedge, the base of which will be the trapesium  $AHIG$ , the length  $IE$  or  $CD$  the length of the prismoid, and the edge  $FE$ , the breadth of the cutting at the lower end of the section.

This wedge may be divided by the vertical plane  $AHE$  into the two pyramids  $AHIGE$  and  $AHEF$ , the base of the first being the trapesium  $AHIG$ , and its height the line  $IE$  or  $CD$ , the length of the prism. The base of the other is the triangle  $FEH$ , and its height a perpendicular  $AR$  let fall from the vertex  $A$  to the plane  $HIEF$ .

The solid content of the prismoid will therefore be equal to the content of the regular prism  $HBCIFKDE$ , and the two pyramids  $AHIGE$ , and  $AHEF$ .

Let  $BC = b$ , the breadth at the bottom of the cutting.

$ML = h$ , the perpendicular depth of cutting at the higher end.

$ON$  or  $MQ = h'$ , the perpendicular depth of cutting at the lower end.

$CD = l$ , the length of the solid.

$PI = r h'$ , the ratio of the perpendicular height of the slope to its horizontal base, multiplied by the height  $MQ$  or  $ON$ .

Then the content of the prism  $HBCIFKDE$  will be equal to the area of the end  $FKDE$ , or  $HBCI$ , multiplied by  $CD$ ; or to  $BC + PI \times MQ \times CD = \overline{b + h'r} \times h' \times l$ . The content of the pyramid  $AHIGE$  is equal to the area of its base  $AHIG$ , multiplied by  $\frac{1}{3}$  its height  $IE$ ; or to

$[(b+rh)h - (b+rh')h']\frac{l}{3}$  for the area of AHIG is equal to the difference of the areas of the ends ABCG and FKDE. And the content of the pyramid AHEF is equal to the area of the triangle HEF,  $\times \frac{1}{3}$  AR, or to  $\frac{1}{2}$  EF  $\times$  HF  $\times \frac{1}{3}$  AR  $= \frac{b+2rh'}{2} \times l \times \frac{h-h'}{3}$  for AR = LQ =  $h-h'$ .

The content of the prismoid ABCGFKDE will therefore equal the sum of these three quantities; that is,

$$\begin{aligned}
 &= (b+rh')h' \times l + [(b+rh)h - (b+rh')h']\frac{l}{3} + \frac{b+2rh'}{2} \\
 &\times l \times \frac{h-h'}{3} \\
 &= [3(b+rh')h' + (b+rh)h - (b+rh')h' + \frac{b+2rh'}{2} \\
 &\quad \times \overline{h-h'}]\frac{l}{3} \\
 &= [2(b+rh')h' + (b+rh)h + \frac{b+2rh'}{2} \times \overline{h-h'}]\frac{l}{3} \\
 &= [4(b+rh')h' + 2(b+rh)h + (b+2rh')(h-h')]\frac{l}{6} \\
 &= [4bh' + 4rh'^2 + 2bh + 2rh^2 + bh + 2rh'h' - hh' - \\
 &\quad 2rh'^2]\frac{l}{6} \\
 &= [3bh' + 2rh'^2 + 3bh + 2rh^2 + 2rh'h']\frac{l}{6} \\
 &= [2bh' + bh' + rh'^2 + rh'^2 + 2bh + bh + rh^2 + rh^2 + \\
 &\quad 2rh'h']\frac{l}{6} \\
 &= [(b+rh')h' + (b+rh)h + 2bh + 2bh' + rh'^2 + rh^2 \\
 &\quad + 2rh'h']\frac{l}{6} \\
 &= \left[ (b+rh')h' + (b+rh)h + 4\left[ b + r\frac{h+h'}{2} \right] \frac{h+h'}{2} \right] \frac{l}{6} \\
 &= \text{area of each end, added to four times the middle area,} \\
 &\text{and the sum multiplied by the length divided by 6.}
 \end{aligned}$$

## DESCRIPTION OF THE TABLES.

---

THE first series of Tables, from 1 to 22, are calculated to such bases and slopes as usually occur in practice. By these Tables the number of cubic yards in cuttings and embankments are ascertained, by multiplying the tabular number by the length in feet between the respective heights marked on the section.

The second series of Tables, from 23 to 33, are calculated to a base of one foot, and to slopes varying from  $\frac{1}{2}$  to 1—to 3 to 1. These Tables are applicable to any base, and will be of use when a work occurs which requires a base different from any given in the first series. In the practical application of this series, two multiplications are necessary instead of one.

The third series of Tables, from 34 to 36, are applicable to sections of turnpike roads, and are calculated according to the bases and slopes used by Mr. Telford on the Holyhead road. These Tables require but one multiplication in practice.

## EXEMPLIFICATION OF THE USE OF THE TABLES.

Suppose  $a b c d e$ , (Fig. 2, Plate I.,) to represent the surface of the ground, over which a proposed railway is to be made, and the line  $a e$  the level of the bottom of the cutting, and let the cross section of the railway be represented by Fig. 3, Plate I. The number of cubic yards of earth in this section will be found by Table 16, which is applicable to the given cross section, that is, to a base of 30, and slopes  $2\frac{1}{2}$  to 1. Thus, look for the first height (20) in the horizontal columns at the top or bottom of the page, and for the second height (50) in the vertical columns at either side of the page: at the intersection of these lines will be found the number 159.26; multiply this number by the length between the vertical lines, marked 20 and 50 on the section, Fig. 2, that is, by 400; the product, 63,704, will be the number of cubic yards in the first division of the section, marked A. Next, in column marked 50, at the top of the page and opposite 45, in the side column will be found the number 261.88; this, multiplied by 300, the length between the vertical lines, marked 50 and 45 on the section, will give 78.564, the cubic yards in the second portion of the section marked B, in Fig. 1. Proceed in the same manner for the other portions of the section marked C, D, E, F, and arrange the work as in the annexed example.

Should the longitudinal sections be laid down by a scale of links instead of feet, the result given by the Tables should be multiplied by the decimal .66 in order to get the true content.

## EXAMPLE 1.

*By the Tables.*

Table No.	159.26	261.88	110.03
length	400	300	530
	<hr style="width: 50%; margin: 0 auto;"/>	<hr style="width: 50%; margin: 0 auto;"/>	<hr style="width: 50%; margin: 0 auto;"/>
A =	63704.00	B =	78564.00
	<hr style="width: 50%; margin: 0 auto;"/>		<hr style="width: 50%; margin: 0 auto;"/>
			330090
			55015
			<hr style="width: 50%; margin: 0 auto;"/>
			C = 58315.90
			<hr style="width: 50%; margin: 0 auto;"/>

T. No. =	62.35	153.09	71.60
	450	210	1000
	<hr style="width: 50%; margin: 0 auto;"/>	<hr style="width: 50%; margin: 0 auto;"/>	<hr style="width: 50%; margin: 0 auto;"/>
	311750	153090	F =
	24940	30618	71600.00
	<hr style="width: 50%; margin: 0 auto;"/>	<hr style="width: 50%; margin: 0 auto;"/>	<hr style="width: 50%; margin: 0 auto;"/>
D =	28057.50	E =	32148.90
	<hr style="width: 50%; margin: 0 auto;"/>		<hr style="width: 50%; margin: 0 auto;"/>

These products collected will be as follows:—

A = 63704.00
B = 78564.00
C = 58315.90
D = 28057.50
E = 32148.90
F = 71600.00
<hr style="width: 50%; margin: 0 auto;"/>

The sum of which is 332390.30 = the true quantity, in cubic yards.

This example worked by the Tables requires 172 figures ;  
to work out the same result *without the Tables will require*  
802 figures.

## EXAMPLE 2.

The same section, calculated by the Prismoidal formula, without using the Tables will be as follows :—

375,877.30 cube yards by the incorrect method of mean areas.  
332,390.30 by the true method.

43,487.00 error in excess, by this method of calculation.

The number of figures required by this process is 501.

## EXEMPLIFICATION OF THE USE OF THE SECOND SERIES OF TABLES.

### EXAMPLE 5.

Let  $abcde$ , (Fig. 4, Plate I.,) represent the ground line, or longitudinal section of part of a canal, and  $abcdefgh$ , (Fig. 5,) a cross section of the same canal. As that part of the canal below the level of the towing path is uniform, it may be calculated at one operation, as follows. Examine the first series of Tables to see if there be one corresponding to the given base and slopes; if there is, proceed as in the first example; if not, turn to the second series, and find the Table corresponding to the given slopes, which in this case is Table 25; look along the upper line of the page for the given depth below the level of the towing path, which in this example is six feet; next look along either of the side vertical columns for the same depth, six feet; at the intersection of these lines there will be found in the column of multipliers the number .2222, and in the column of additions the number 1.333. Set these numbers down and multiply the given base by the multiplier, and to the product add the number taken from the addition column, the sum will be the mean area, which is to be multiplied by the length of the section, for the content in cube yards.

Thus,

The multiplier =	2222
base =	16
	-----
	13332
	2222
	-----
	3.5552
add =	1.333
	-----
	4.888
Total length of section from <i>a</i> to <i>e</i> =	2500
	-----
	24440.00
	9776
	-----
Cube yards =	12,220.000
	-----

As the width at the bottom of the canal is sixteen feet, the slopes 1 to 1, and the depth from the level of the towing path to the bottom of the canal six feet; the width from bank to bank at the level of the towing path, or from *c* to *f*, will be twenty-eight feet, and the whole width of cutting at the same level from *b* to *g* will be forty-two feet.

As there is no Table in the first series calculated to this base, it will be necessary to have recourse to Table 27 of the second series, which is calculated to the given slopes of  $1\frac{1}{2}$  to 1, and base 1.

In taking out the tabular numbers from this Table, it must be observed that the depths of cuttings marked on the vertical lines *a b c d e* of Fig. 4, are supposed to be to the surface of the water, which is one foot below the level of the towing path; it will therefore be necessary to subtract one foot from each of these heights in looking for the tabular numbers.

The calculation will therefore be as follows,

Heights.	Tabular Num.	
	Mult.	Add.
A = 3 — 24 ....	0.5000	12.167
B = 24 — 44 ....	1.2593	66.074
C = 44 — 14 ....	1.0741	50.889
D = 14 — 11 ....	0.4630	8.722

Mult.	Base.	Add.	Length.	Cube yard.
.5000	× 42	+ 12.167	× 100	= 331.67
1.2593	× 42	+ 66.074	× 1000	= 118,964.60
1.0741	× 42	+ 50.889	× 800	= 76,800.96
0.4630	× 42	+ 8.722	× 600	= 16,900.80
Cubic content above the level of the towing path				212,998.03
Cubic content below the level of the towing path as before found				12,220.00
Total content of section				= 225,218.03

## EXEMPLIFICATION OF THE USE OF THE THIRD SERIES OF TABLES.

### EXAMPLE 6.

Let  $abcdefg$ , (Fig. 6, Plate II.,) represent a section of the ground over which a turnpike road is to be made, and  $klmn$ , Fig. 7, the cross section of the road. Table 36 in the third series is calculated to the required base 31, and slopes 2 to 1 on one side, and 3 to 1 on the opposite side: the calculation will therefore be as follows:—

	Heights.	Tab. No.	Lengths.	Content in cube yards.
A =	25 — 20	— 72.90	× 200	= 14580
B =	20 — 10	— 38.83	× 400	= 15532
C =	10 — 12	— 23.86	× 100	= 2386
D =	12 — 18	— 38.33	× 1000	= 38330
E =	18 — 20	— 55.27	× 800	= 44216
F =	20 — 0	— 38.83	× 900	= 34947
Total content of section				149991

### EXAMPLE 7.

Let it be required to ascertain the quantity of cutting and embanking in the section represented by Fig. 8, Plate II.

By the common method of mean heights the cuttings will be found to amount to

	121,554 cube yards
The embankments to	121,756 cube yards
	-----
Difference only	= 202

By Table 6 the quantity of cubic cutting is found to be,

Heights.	Tab. No.			
0 — 25	— 25.46	×	300	= 7,638
25 — 30	— 72.69	×	900	= 65,421
30 — 0	— 33.33	×	400	= 13,332
				<u>          </u>
Cutting =				<u>86,391</u>

By Table 12 the true quantity of embankment will be found as follows :

Heights.	Tab. No.	Length.	Cube yds.	
0 — 15	— 15.56	×	800 = 12,448	
15 — 0	— 15.56	×	400 = 6,224	
0 — 35	— 53.58	×	400 = 21,432	
35 — 40	— 154.32	×	300 = 46,296	
40 — 0	— 66.17	×	700 = 46,319	
<u>          </u>				
Embanking =				<u>132,719</u>

Embanking	132,719
Cutting	86,391
<u>          </u>	

Deficiency of earth to make the embankments	.	.	.	46,328	cubic yards.
<u>          </u>					

This example alone will be sufficient to show how important it is to contractors to calculate cuttings and embankments by the true formula, for in such cases as this, a contractor who calculated by the common method of mean heights would imagine he had only two hundred and two cube yards of earth to carry from back cutting, whereas in reality he would be required to find 46,328 cube yards over and above what the cutting would produce, and what he had calculated upon, and this quantity at the low price of fourpence per cube yard would amount to *772l. 2s. 8d.*

## EXEMPLIFICATION OF THE TABLE

*For ascertaining the quantity of land necessary for the formation of a canal, railway, or turnpike road.*

*Rule.*—Add any two adjacent heights or depths of cuttings together, multiply the sum by the ratio of the slopes, in the cuttings or embankments; add to this product the width of the cutting at bottom, or embankment at top, and look for the sum in the side columns in the Table; take out the corresponding tabular number, which number multiplied by the length in feet between the heights, will give the acres and decimal parts of an acre that will be required for the given cutting.

Thus, let it be required to determine the superficial quantity of land required for the railway, a section of which is given in Plate I., Fig. 2.

The calculation will be as follows:—

	Heights.	
	20 + 50 = 70	
Multiply by ratio of slopes	2.5	
	———	
	350	
	140	
	———	
	175.0	
add the base	30	
	———	
Tabular number corresponding to	205 =	.0047061
Multiplied by length	400	
	—————	
Acres and decimals	1.8824400	
or 1 acre 3 roods 21 perches.

3¾ to 4 do. . . . .	12½	8½	4⅛	25⅞

*The following methods are those generally used in calculating the quantity of earth-work in canals.*

## MENSURATION OF CANALS.

### *1st Method.*

To the bottom breadth add the two heights, that sum multiplied by the sum of heights, and from the product deduct the rectangle of the two heights; the difference multiplied by half the length of the section, will give the true content of the section.

### *2nd Method.*

Add the greater depth and bottom breadth together, multiply this sum by the sum of the two heights, and to the product add the square of the lesser height; this sum multiplied by half the length, gives the content of the section.

N. B. The difference between taking a mean or middle dimension in any piece of cutting or irregular solid, and the true method, is, the square of the difference of the two heights multiplied by  $\frac{1}{3}$  of the length of the section.

### *3rd Method.*

#### CASE I.

In any even cutting where the cross section is the same.

*Rule.*—Multiply the perpendicular depth of the section by the ratio of the slopes; to this product add the bottom width of the canal; multiply this sum again by the depth

of the section, and this last product will be the area of the section in the same dimensions the measures are taken in.

N. B. The ratio of the slopes is the length of the horizontal set-off, answering to one in the perpendicular.

#### CASE II.

When any two sections are of unequal depths, but the ground between them has a regular descent or ascent.

*Rule.*—Add the perpendicular depths of the two sections together, and square the sum; from this square subtract the product of the two depths multiplied by each other; multiply the remainder by one-third the ratio of the slopes, and reserve the product. Again, multiply the sum of the two depths by half the bottom width of the canal, and to this product add the product before reserved. This sum will be the *mean area* between the two sections: the same as before with regard to the dimensions.

#### CASE III.

In any piece of cutting where the ground surface at one end is exactly bottom level of the canal.

*Rule.*—Multiply the square of the perpendicular depth of the section; at the other end, by  $\frac{1}{3}$  the ratio of the slopes. To this product add the depth of the section, multiplied by half the bottom width of the canal; the sum will be the mean area as before.

N. B. In any of these cases, the mean area multiplied by the length of the piece gives the solid contents without any benching. The content of the benching may be thus found.

*Rule.*—From the perpendicular depth of each section subtract the depth of the canal to top bank level; add the two remainders together, and multiply half their sum by the whole width of the benchings on both sides, for a mean area; which, multiplied by the length of the piece, gives the content of the benching.

*Embankments* are only an inversion of cuttings, and therefore the above rules hold good, with this difference, viz. the top width of the canal, including both its banks, must be substituted here instead of the bottom width of the canal in the above.

---

## MEASURING CANALS.

### 4th Method.

*Problem*—To find the area of any transverse section taken at right angles across the line of canal. (Fig. I. Plate 3.)

#### CASE I.

Is when the depths  $dd$  of the section, from the ground surface  $ss$  to the bottom level  $b$  of the canal, are everywhere the same.

*Theorem*— $(rd + b) \times d =$  the area.

*Rule*.—Multiply the common depth of the section by the ratio of the inside slopes of the canal, and to the product add the canal's bottom width; multiply this sum by the aforesaid depth, and the product will be the area.

*Example*.—Let us suppose (as in the Ellesmere canal) the bottom width to be 16 feet, and the recedence or ratio of the slopes to be as 1.5 horizontally to 1 perpendicular, and let the depth of the section be 8 feet.

Here,

$$\begin{array}{r}
 r = 1.5 \\
 d = 8. \\
 \hline
 rd \quad 12.0 \\
 b = 16.0 \\
 \hline
 rd + b = 28.0 \\
 d = 8 \\
 \hline
 \end{array}$$

224 the area in feet as required.

## CASE II.

Is when the depth  $dd$  of the section from the ground surface  $ss$  to the bottom level  $d$  of the canal are unequal. (Fig. II. Plate 3.)

$$\textit{Theorem}—r d d + \frac{d+d}{2} \times b = \text{area.}$$

*Rule.*—To the rectangle of the depths multiplied by the ratio of the slopes, add half the sum of the depths multiplied by the bottom width of the canal, and the sum will be the area.

*Example.*—Let the least depth be 6 feet—the greatest, 8 feet, and let every thing else remain as before.

Here,

$r = 1.5$	Again	$d = 6$
$d = 6$		$d = 8$
$r d = 9.0$		2 ) 14
$d = 8$		7
$r d^2 = 72$		$\frac{d+d}{2} = 7$
112		$b = 16$
134 = area		$\frac{d+d}{2} \times b = 112$

## CASE III.

Is when the surface of the ground (S S) (Fig. III. Plate 3,) intersects the bottom ( $b$ ) of the canal. In this case ( $d$ ) is the depth which the surface of the ground is below the bottom level of the canal at the point whence the produced inside slope of the embanked side meets the said surface.

$$\textit{Theorem}, \frac{\frac{1}{2}b - rd}{d + D} \times D^2 = \text{the area.}$$

*Rule.*—Multiply that depth which is under the bottom level, by the ratio of the inside slopes, and subtract the product from half the bottom width of the canal, divide this difference by the sum of the depths, and multiply the quotient by the square of the depth, which is above the bottom level, the product will be the area.

*Example.*—Let the depth which the bottom level of the canal is below the surface of the ground, be eight feet, and the depth on the other side which the ground's surface is below the bottom level of the canal, be two feet, and let every thing else remain as before.

Here,

$$\begin{array}{rcl} \frac{1}{2} b = 8 & D = 8 & \frac{4.5}{10} = 45 = 5 = \frac{\frac{1}{2} b - rd}{d + D} \\ rd = 3.5 & d = 2 & \\ \frac{1}{2} b - rd = 4.5 & d + D = 10 & .45 \times D^2 = 64 \times 45 = 28.80 \text{ the area.} \end{array}$$

*Problem.*—The area of any irregular section being known, to find a mean depth which a regular section must have to be of the same area.

*Theorem,*— $\sqrt{\frac{a}{-r} + \frac{b}{2r}} - \frac{b}{2r}$  = the mean depth, where  $a$  = the area of the regular section.

*Rule.*—Divide the bottom width of the canal by twice the ratio of the inside slopes, reserve the quotient. To the area of the section, divided by the said ratios, add the square of the quotient reserved, extract the square root of the sum, and from this root subtract the quotient reserved: the remainder will be the mean depth required.

*Example.*—Take the area of the figure 2 for case the 2nd.

Here,

$$\begin{array}{rcl} 3 \ ) \ 16 & & \\ \underline{5.3} & & \\ 5.3 & & \\ \hline & & \\ \underline{159} & & \\ 265 & & \\ \hline & & \\ 28.09 & = & \left( \frac{b}{2r} \right)^2 \\ & & \hline & & 100 \\ & & \hline & & 90 \\ & & \hline & & 10 \end{array} \quad \begin{array}{rcl} 1.5 \ ) \ 184.0 & (12.26 & = \frac{a}{r} + \left( \frac{b}{2r} \right)^2 \\ \underline{15} & + \ 28.09 & \\ & & \\ & & \\ \underline{34} & & \\ 30 & & \\ \hline & & \\ & & \\ \underline{40} & & \\ 30 & & \\ \hline & & \\ & & \\ \underline{6.3 - 5.3} & = & \sqrt{\frac{a}{r} + \left( \frac{b}{2r} \right)^2} - \frac{b}{2r} \text{ the} \\ & & \text{mean required.} \end{array}$$

## ON SETTING OUT CANALS.

Suppose BCDEF to represent the section of a canal, ABCI, and EFGH those of the banks, and LOM the inclination of the land, it is required to set it out so that the part cut or excavated,  $x C E y$ , may raise the banks to the height designed.

Continue the outside slopes of the banks till they meet in the point P, and the inside ones till they meet in the point  $k$  and  $v$ . Join  $k v$ , make  $P r = 1$ ; draw  $q r$  parallel to  $k v$ , and  $q t u$  parallel to LOM, the surface of the land. Then, since  $q s$  is horizontal,  $P r$  to  $q r$  is the ratio of the slopes, and  $q r$  to  $r t$  that of the land.

Now, since the part to be cut must be equal to the banks to be raised, the area  $x C E y$  is equal to the areas,  $A B x L$  and  $F y M G$ ; if to these equal quantities be added the common area  $x B A k l v G F y x$ , the area  $L A k l v G M L$  will be equal to the area  $C B A k l v G F E C$ , which is known. The areas of the triangles  $P q u$  and  $P L M$  are likewise known; therefore, since similar triangles are as the square of their like dimensions, it will be as the area of the triangle  $P q u$ :  $P t^2$  :: area  $P L M$  to  $P O^2$ ; and  $P O$  taken from  $P D$  gives  $O D$ , the depth of cutting in the centre of the canal.

If  $P N$  be the side of the square = double the area  $P A B C E F G P$ , from  $q s$  let fall the perpendicular  $u s$ , take  $b e = q s$ ; on  $P e$  describe the semicircle  $P f e$ , erect the perpendiculars  $b f$ , and take  $P h = b f$ , join  $b h$ , and, parallel thereto, draw  $N O$  cutting  $P D$  in  $O$ , which will be the point required.

For twice the triangle  $P q u$  is  $P t \times q s = P t \times b e = b f^2 = P h^2$  by construction, and since  $N O$  is parallel to  $h t$ , it will be  $P h^2 : P t^2 :: P N^2 : P O^2$  and  $P h : P t :: P N : P O$ .

$$\begin{aligned}\text{Let } P r &= 1 \\ q r &= 1.5 \\ b r &= 0.5\end{aligned}$$

$$\text{As } 1 : 1.5 :: 0.5 : n r = \frac{.75}{1} = .75$$

$$q r = 1.5 - .75 = .75 = q n$$

$$\text{As } q n : b r :: q s : n z$$

$$\text{Or } .75 : .5 :: 3 : \frac{1.5}{.75} = \frac{5}{25} = \frac{1}{5} = z = n z.$$

*Cor.* 1st. Where  $l$  coincides with  $t$ , the back part of the bank and land are of the same height, and therefore requires no puddle gutter.

2nd. When  $l$  and  $B$  coincide, the land on the higher side is bank height, and therefore wants no raising.

3rd. Where  $b$  and  $r$  coincide, the land becomes level.\*

*Description of an Instrument for determining and setting out the line of Slopes, in Cuttings and Embankments.*

As connected with the foregoing subject of cuttings and embankments, I have given in Plate IV. a drawing of an instrument which I made a few years ago, and which has been found of great service in the practical operation of marking out on the ground the line of slopes for cuttings and embankments, particularly on sloping ground, or where side cutting and embanking is necessary.

The instrument is extremely simple and easily used: when adjusted to any slope of ground and cutting, it represents half the transverse section at that particular point.

Thus, suppose the centre line of a railway or turnpike

\* The foregoing rules for laying out canals, &c., are extracts from Mr. Telford's Common-place Book.

road to be marked out along the sloping side of the hill, the inclination of which at right angles to the centre line is found to be (say)  $5^{\circ} 0'$ , that the slopes of the cutting are to be 1 to 1; that the width at the bottom of the cuttings is to be 30 feet, and that the depth of cutting at any particular point is 20 feet; it is required to determine at what distance from the centre line, at that particular point, the line of cutting will terminate on the upper side.

1st. Unclamp the bar C D, by easing the screw  $d$ ; and move it backward or forwards in its groove until 20, the depth of cuttings, coincides with the index point on the side of the groove at  $e$ , and screw it fast.

2nd. Move the quadrant along the groove in the bar A B, until the fiducial edge E, in a line with the centre of the quadrant, cuts division 15 on the bar A B, which represents half the width at the bottom of the cutting, and clamp it fast.

3rd. Turn the index F G round its centre until the edge F G coincides with the division 1 to 1, which marks the rate of the slopes of the cuttings on the limb of the quadrant L M, and screw it fast.

4th. Turn the index or arm N O P, round its centre O, until the zero point on the vernier Q coincides with the 5th degree, which indicates the sloping surface of the ground, and clamp it fast; then the division 39 on the index N O, intersected by the edge F G of the index or arm F G will show the number of feet, which must be laid off from the centre line, to mark the extremity of the cuttings.

THE END.
